Detailed Reviewer's Report

Overall assessment

The manuscript addresses a relevant nursingeducation topic improving nursing students' knowledge regarding the management of epilepsy. A one-group pre-test/post-test approach is reported, and the results suggest an increase in the mean knowledge score after the educational intervention.

Minor comments

1.Edit the manuscript for grammar, spelling, spacing, capitalization and academic style

2.Use consistent terminology for the study design (one-group pre-test/post-test quasi-experimental design) and for the intervention throughout.

3.Correct the results heading that refers to GNM students if the actual participants were B.Sc. Nursing students.

4.Clarify the intervention throughout the manuscript. The title and conclusion refer to an "information booklet", while the abstract and objectives describe a "structured teaching programme". State exactly what intervention was delivered (booklet, teaching session, or both), its content, duration, mode of delivery and timing between pre-test and post-test.

5.Provide a clear description of the research instrument: how the 30-item structured questionnaire was developed, its domains, scoring range and cut-off points for poor/average/good knowledge.
