Reviewer's Comment for Publication.

The manuscript presents a relevant and well-organized review of sustainable agriculture and soil health, with appropriate attention to soil conservation, crop diversification, conservation agriculture, organic amendments, integrated nutrient management, agroforestry, integrated pest management, water conservation, climate resilience, and the economic and social dimensions of sustainable farming. The paper is generally clear, logically structured, and provides useful practical and policy-oriented perspectives on improving agricultural sustainability and food security. However, the manuscript would benefit from minor revisions before publication. In particular, the authors should strengthen the literature review by incorporating a broader range of recent peer-reviewed studies, provide more critical comparison and synthesis of the cited literature rather than primarily descriptive discussion, and clarify the literature-search and selection procedure used for the narrative review. Some repetitive statements across the sections on environmental benefits, climate resilience, and soil health could also be condensed, and the references, formatting, and language should be carefully checked for consistency. Subject to these minor improvements, the manuscript is suitable for publication.
