Detailed Reviewer's Report

1. An attitude is a relatively enduring evaluation or mental position regarding a person, object, or concept. It functions as an internal state of readiness that influences how you think, feel, and behave in response to a specific situation.
2. Early detection finds diseases before you have symptoms. This helps treatments work much better. For example, when lung cancer is found at stage one, the chance of a cure is about 90%. When found at stage four, the chance is very low.
3. Breast cancer is the most common cancer in women, occurring when cells in the breast grow uncontrollably to form a tumor. Early detection through regular screening is vital, with the 5-year survival rate for localized tumors now exceeding 90%.
4. Breast cancer is a disease where abnormal cells in the breast tissue multiply uncontrollably, usually starting in the milk ducts or lobules. These cells can form a tumor. If untreated, the cancer can spread (metastasize) to nearby lymph nodes or other organs. While it primarily affects women, men can also develop breast cancer.

REVIEWER'S REPORT

- 5. Early detection is the proactive identification of a disease or medical condition at its initial, most manageable stage—often before noticeable symptoms appear or the disease has spread. It is a cornerstone of preventative healthcare, allowing for simpler, less invasive, and more successful treatment.**
- 6. An attitude is an individual's settled way of thinking, feeling, or behaving toward a person, object, or concept. In psychology, it is a psychological tendency expressed by evaluating a specific entity with some degree of favor or disfavor, typically shaping how one responds to the world.**
- 7. The effectiveness of an educational program is how well it reaches its goals. You measure it by looking at student test scores, attendance rates, and new skills learned. To understand if a program works, schools and researchers track student progress over time to see what helps kids grow the most.**
- 8. Women generally view early detection of breast cancer as highly important. They know it improves survival rates and leads to simpler treatments. However, many women fail to get routine checks due to fear of the results, lack of time, or not understanding screening guidelines.**
- 9. Early detection of breast cancer drastically improves treatment options and survival rates, with a 5-year relative survival rate over 99% when caught localized. It relies on regular screening mammograms, clinical exams, and knowing your body's normal baseline to spot warning signs early.**
- 10. Key words must be added more.**
- 11. Research topic is significant and helpful for medicine.**
- 12. Abstract is meaningful.**
- 13. Result part is awesome with values and graphs.**
- 14. Summary points only can be added.**
- 15. After those changes good to publish in your journal.**
