Detailed Reviewer's Report

This manuscript investigates prescribing patterns of antidiabetic and lipid-lowering drugs using WHO core prescribing indicators in a hospital-based outpatient setting in India. The topic is clinically relevant and the sample size of 600 prescriptions is adequate. However, the submission in its current form contains only the abstract. Without the full manuscript — Introduction, Methods, Results, Discussion, Limitations, and References — a thorough review is not possible.

The abstract itself presents coherent findings, suggesting the underlying study may have substance, but the work needs to be submitted in its entirety.

Incomplete Submission Only the abstract has been provided.
