Detailed Reviewer's Report

- 1. Diagnostic disclosure is the process of informing patients about the nature, prognosis, and treatment options for their illness, functioning as both a legal obligation and a moral duty in modern medicine. It is crucial for patient autonomy and informed consent, often guided by protocols like SPIKES to manage emotions, though it varies culturally.**
- 2. The physician-patient relationship is a foundational, trust-based covenant dedicated to promoting patient welfare, characterized by mutual respect, confidentiality, and shared decision-making. It is considered the core of ethical medical practice, built on communication, knowledge, loyalty, and regard to improve health outcomes and provide optimal care.**
- 3. Crohn's disease is a chronic inflammatory bowel disease (IBD) that causes inflammation anywhere along the digestive tract, most commonly the small intestine. It causes, abdominal pain, severe diarrhea, fatigue, weight loss, and malnutrition. While there is no cure, it is managed through medication, diet, and sometimes surgery.**

REVIEWER'S REPORT

- 4. Morocco is a North African kingdom bordering the Atlantic Ocean and Mediterranean Sea, known for its rich Berber, Arabian, and European cultural influences. Featuring cities like Rabat (capital), Casablanca, and Marrakech, it offers diverse landscapes including the Atlas Mountains and Sahara Desert. Popular for tourism, its culture includes vibrant, historic medinas and traditional cuisine.**
- 5. Inflammatory bowel disease (IBD) is a group of chronic, autoimmune-mediated, and progressive conditions—primarily Crohn's disease and ulcerative colitis—causing long-term, severe inflammation of the digestive tract. Symptoms include chronic diarrhea, abdominal pain/cramps, fatigue, weight loss, and bloody stools. Treatment, aiming for remission, involves immunosuppressants, biologics, steroids, and surgery.**
- 6. Early signs of Inflammatory Bowel Disease (IBD) often involve persistent digestive issues like chronic diarrhea, abdominal pain/cramping, blood in stool, fatigue, and unintended weight loss, but can also manifest as joint pain, mouth sores, or skin rashes, signaling inflammation outside the gut. Because IBD symptoms can start subtly and mimic other conditions, persistent digestive upset, especially with blood or night symptoms, warrants a doctor visit for early diagnosis and management.**
- 7. IBD causes the body's natural defenses (the immune system) to mistakenly attack healthy bowel cells. These are a type of autoimmune disease in which autoantibodies are not detected in common laboratory tests. An autoantibody is a special kind of protein made by the immune system that attacks the body's own proteins.**
- 8. Key words are good.**
- 9. Abstract and result part are awesome with pie chart.**
- 10. Summary points must be included.**
- 11. References should be in alphabetical order.**
- 12. After those changes good to publish in your journal.**
