Detailed Reviewer's Report

This is a well-designed, relevant, and timely study addressing antibiotic resistance in environmental drinking water isolates from a resource-limited setting. The methodology is sound, data presentation is clear with good use of tables and figures, and the discussion is appropriately contextualized with recent literature. The manuscript is well-written and suitable for publication as it is or after minor a revision.

Minor Comments

Inconsistent numbering of tables – Table 4 is very long and spans multiple pages; consider splitting into separate tables by organism for readability.
