

# MODEL OF THE ELECTORAL REGISTRATION INFORMATION SYSTEM IN MOZAMBIQUE.

## Abstract

Electoral Registration (ER) is essential for the legitimacy of elections in Mozambique, and it is crucial to ensure that all citizens have access to the political process. The objective of this article is to propose an efficient model for the Electoral Registration Information System in Mozambique, which integrates modern technologies to optimize the registration process, improve data accuracy and increase citizen participation. The research used a qualitative approach, using a combination of data collection methods, including direct observations, document analysis, literature review, questionnaires and interviews with relevant stakeholders. The results indicate that the excessive use of paper materials in the years 2018, 2019, 2023 and 2024 had a negative impact on both the efficiency of the system and its environmental impacts. The research revealed that eliminating these redundant materials could significantly improve the effectiveness of the Electoral Registration Information System (ERIS).

**Keywords:** Electoral Registration. Modern Technologies. Environmental Impacts.

## 1. Introduction

The Electoral Register (ER) is highly relevant to the conduct of voting processes. It is through this process that citizens of active voting age, and those who will reach that age by the day of a given election, are registered in the electoral rolls. Furthermore, they acquire voter cards in order to vote. Beyond voter cards and electoral rolls, the information resulting from the ER is particularly relevant for quantifying all the electoral equipment necessary for conducting the voting processes, as well as for planning electoral logistics. That is, the ER provides essential data for making decisions about the total number of polling stations, the allocation of voters to polling stations, the quantity of voting equipment needed, the number of vehicles needed for the distribution and collection of voting equipment, and for the supervision of the process, the total number of Polling Station Members (PMMs) to be hired, and the planning of the budget necessary for carrying out the process.

### 1.1. Problem Definition

31 According to Malhotra, Ebster, and Garaus (2013), the ability to reduce costs and avoid  
32 waste is a strategic factor for organizations in today's market, in order to maximize  
33 efficiency.

34 Issues involving environmental problems, such as the depletion of non-renewable  
35 natural resources and economic growth disconnected from sustainable development,  
36 have become a major global concern in recent years (Lunardi and Frio, 2012).

37 Given that the ERIS (Integrated Electoral Registration System) is mixed, i.e.,  
38 simultaneously digitized and analog, this scientific study is justified in order to assess  
39 the relevance of using paper-based electoral materials, especially for the Government of  
40 Mozambique, the National Elections Commission (CNE), the Technical Secretariat for  
41 Electoral Administration (STAE), and stakeholders, and consequently evaluate the  
42 system's efficiency.

43 The partial digitization process of the Electoral Review in 2018, 2019, 2023, and 2024  
44 was costly, mainly due to the financial resources used to acquire redundant paper-based  
45 electoral materials and other supplies. Furthermore, the manufacturing and incineration  
46 processes of these materials generated a proliferation of greenhouse gases. It is obvious  
47 that the negative environmental impacts of the production, processing, consumption,  
48 and incineration of materials are profound and increasing.

49 The scientific research problem identified in this article concerns the redundant use of  
50 paper-based electoral materials at all stages of this electoral process. These materials,  
51 from their manufacture, acquisition, and consumption, cause negative economic and  
52 environmental impacts. In the environmental domain, the proliferation of greenhouse  
53 gas emissions was observed in the raw material, manufacturing, and incineration  
54 processes of these materials after their 5-year shelf life expired.

55

## 56 **1.2. Objective**

57 The objective of this study is to propose an efficient model for the Electoral  
58 Registration Information System in Mozambique, which integrates modern technologies  
59 to optimize the registration process, improve data accuracy, and increase citizen  
60 participation.

61 This study aims to contribute in practice, science, and theory. The practical contribution  
62 can be: i) operational efficiency: the implementation of the proposed model can  
63 optimize the Electoral registration process, reducing queues and improving citizen  
64 participation when registering to vote; ii) access to information: the proposed system

65 model can facilitate access to updated electoral data, allowing for more effective  
66 management of information about voters and their registrations; and iii) transparency  
67 and trust: by improving data accuracy and security, the model can increase public trust  
68 in electoral administration and management institutions, promoting greater civic  
69 participation.

70

## 71 **2. Types of Research**

### 72 **2.1. Type of Research Regarding Approach**

73 This scientific work used a mixed-methods approach. Creswell and Creswell (2021)  
74 state that this method is characterized by the fact that the researcher first conducts  
75 quantitative research; then, proceeds to analyze the results, explained without further  
76 detail through qualitative research.

77 According to Creswell (2010), the mixed-methods approach combines or blends both  
78 quantitative and qualitative methods. Just as it advocates obtaining precise data, it also  
79 advocates a thorough understanding of this data. Not taking them as an absolute answer,  
80 but understanding that the data are part of a whole that needs to be understood as such.

81

### 82 **2.2. Research Type Regarding Nature**

83 From the point of view of its nature, applied research was considered for this work,  
84 since, according to Silva and Menezes (2005), it “aims to generate knowledge for  
85 practical application and is directed towards solving specific problems.”

86

### 87 **2.3. Methodological Procedures**

88 The methodological procedures used in this research are: bibliographic research,  
89 exploratory research, documentary research, and observation. However, these  
90 approaches were chosen because, in fact, according to the problem under study, they are  
91 the ones that provide the right alignment to the results of the research.

92

### 93 **2.4. Bibliographic Research**

94 Gil (1999) explains that bibliographic research is developed using already elaborated  
95 material, mainly books and scientific articles.

96

### 97 **2.5. Exploratory Research**

98 In order to provide greater familiarity with the research problem, with a view to making  
99 it more explicit or building hypotheses, the exploratory research methodology was also  
100 used.

101 Exploratory research provides greater familiarity with the topic, seeking to make it more  
102 explicit and clear (Silva and Meneses, 2001).

103 According to Churchill (1999), exploratory research is indicated in situations where  
104 information about the problem in question is limited.

105 Therefore, this technique was necessary because, due to the nature of the organization  
106 under study, the information is sensitive.

107

## 108 **2.6. Documentary Research**

109 According to Silva and Grigolo (2002), documentary research uses materials that have  
110 not yet undergone any in-depth analysis. This type of research aims, therefore, to select,  
111 process, and interpret raw information, seeking to extract meaning from it and introduce  
112 value to it, thus contributing to the scientific community so that others may play the  
113 same role in the future.

114 Within the scope of documentary research, documents from the institution that had not  
115 undergone any type of scientific analysis were consulted, such as official reports,  
116 communications, and some documents containing formal rules such as electoral  
117 legislation and the Constitutions of the Republic of Mozambique.

118

## 119 **2.7. Observation**

120 According to Marconi and Lakatos (2003), observation is a data collection technique  
121 used to obtain information and utilizes the senses to obtain certain aspects of reality. It  
122 consists not only of seeing and hearing, but also of examining facts or phenomena that  
123 one wishes to study. Through this technique, the researcher observed ER processes that  
124 took place in 2018, 2019, 2023, and 2024, during supervisions conducted at 70 ER  
125 stations and 3 STAE warehouses where ER ballots and other paper-based electoral  
126 materials are stored.

127

## 128 **2.8. Field Research**

129 In the field research, primary data collection was carried out using methods such as  
130 interviews, questionnaires, and direct observations. Direct observations were made at 70

131 ER stations and 3 warehouses where all paper-based electoral materials and their  
132 respective supplies are stored, during the periods under analysis.

133

### 134 **2.9. Sampling**

135 The sample consists of 62 participants, of which 10 are CNE members, 7 are heads of  
136 the Department of Electoral Organization and Operations (DOOE), 15 are DOOE  
137 technicians, 10 are ER Brigade members, and 20 are citizen voters. The criteria used for  
138 selecting the participants, namely the CNE members, DOOE heads, DOOE technicians,  
139 and RE Brigade members, were based on the areas they are involved in, areas that are  
140 aligned with the RE and suffrage, experience, and length of work in these areas, while  
141 for citizen voters, the criterion used was experience in participating in the ERs held  
142 during the periods under analysis.

143

### 144 **2.10. Data Collection Instruments**

145 In this research, data collection instruments included questionnaires with closed-ended  
146 questions on a 5-point Likert scale, individual interviews with selected employees, and  
147 direct observation, primarily to acquire sufficient information to conduct scientific  
148 research on the efficiency analysis of the SIRE (Integrated System for Receiving and  
149 Registering Voters). This data collection technique was chosen to extract relevant  
150 information to characterize the ERIS currently used for voter registration in  
151 Mozambique.

152

### 153 **2.11. Data Analysis**

154 According to Bastos (2024), data analysis is the process of applying statistical and  
155 logical techniques to evaluate information obtained from certain processes. The main  
156 objective of the practice is to extract useful information from the data.

157 Data analysis was carried out in the following terms: first, the research objective was  
158 determined and the problem identified; then, a literature review, document analysis, and  
159 the development of research questionnaires based on questions from a 5-point Likert  
160 scale were conducted. Following this, qualitative and quantitative data were collected  
161 using the research instruments employed; in the next phase, the data were cleaned to  
162 find suitable and reliable data; and finally, the data were analyzed.

163 In the case of a mixed approach, the analysis and systematization of qualitative data  
164 focused on data obtained through observations and document analysis, while the

165 analysis of quantitative data obtained through questionnaires was carried out through  
166 statistical analyses in SPSS. This process began with the insertion of research questions  
167 and the coding of responses on a scale of 1 to 5 (where points 1 and 2 are negatively  
168 associated, point 3 is neutral, and points 4 and 5 are positively associated). Finally, the  
169 analysis included the percentage of processed cases (valid, excluded, and total), the  
170 reliability of questionnaire responses using Cronbach's alpha, and the correlation  
171 between questions.

172

### 173 **2.12. Data Analysis Methods**

174 The methods used for data analysis are: defining questionnaire questions and interview  
175 guides, data collection, data cleaning, and descriptive data analysis.

176

### 177 **2.13. Tools Used for Data Analysis**

178 The tool used to analyze the quantitative data was the Statistical Package for the Social  
179 Sciences (SPSS) software, using a 5-point Likert scale, while for the qualitative data,  
180 there was no need to use a tool and the analysis was based on information obtained  
181 through bibliographic review, document review, and observations.

182

### 183 **2.14. Ethical Considerations**

184 This scientific research was conducted ethically. However, in its execution, the  
185 protection of the rights of all participants was guaranteed, such as: transparency with the  
186 participants about the research, the accuracy of the results, informed consent, the  
187 confidentiality of the participants, anonymity, and above all, the protection of privacy.  
188 Accuracy in the research and data collection was also ensured, crucial aspects to help in  
189 making fact-based decisions. The ethical integrity of the research, the protection of  
190 personal data contained in two voter registration cards used as figures in this research,  
191 and intellectual property rights were also guaranteed. However, all authors of the  
192 documents consulted are listed in this dissertation through bibliographic references.  
193 Furthermore, before beginning data collection, participants received prior information  
194 regarding the protection of their rights.

195

## 196 **3. Presentation of Results**

### 197 **3.1. Description of ERIS and Presentation of the Proposed Model**

198 ERIS allows for the collection, processing, and storage of information in the context of  
 199 electoral censuses. Electoral registration processes can be manual, computerized, or  
 200 mixed. The first electoral registration in Mozambique was carried out in 1994, the  
 201 second in 1999, and the third in 2004. These three electoral registration processes were  
 202 characterized by being completely manual. During this period, information was stored  
 203 only in physical format, at the Electoral Registration Posts, especially during the periods  
 204 when the registrations were carried out, and in the STAE warehouses, specifically after  
 205 these electoral processes were completed.

206 In 2007, due to the limitations presented by the manual ERIS, and on the other hand,  
 207 due to the advancement of modern digital technology, the biometric ERIS was  
 208 introduced for the first time in the context of electoral administration in Mozambique.  
 209 In parallel with computerized registration, manual registration was also carried out in  
 210 some stages of ERIS, such as electoral registers and electoral registration forms. In the  
 211 current approach, the ERIS (Integrated Voter Registration System) is digitized,  
 212 consisting of the collection of biographical and biometric data (photographs and  
 213 fingerprints) of voting citizens of active electoral age, typing, processing and printing of  
 214 electoral documents such as voter cards, voter registration forms, weekly and monthly  
 215 reports, electoral registers, and storage of information pertaining to voter registrations in  
 216 a digital database, through the Mobile Identity Document (ID).

217

218 **Table 1: Comparison of ERIS models used in other countries (Adapted from**  
 219 **Siqueira 2012).**

<b>Electoral Registraion Technology</b>		
<b>Country</b>	<b>Type</b>	<b>Model</b>
Mozambique.	Biometric/Active.	Decentralized System. Data consolidation is done regionally.
Cape Verde.	Biometric/Active.	Integrated and online system. Data between RE stations is updated daily.
Guinea-Bissau.	Manual/Active:	Manual data capture via forms. Data entry into the system uses double-blind data entry.
São Tomé and Príncipe.	Biometric.	Decentralized. Data consolidation is centralized.
Timor-Leste.	Biometric/Active.	Decentralized. Data consolidation is centralized.

		The system captures biometric data (photo and fingerprints) but the Automated Fingerprint Identification System (AFIS) and Facial Recognition System (FRS) are not implemented.
Netherlands	Biometric/Passive	Voting system citizens are automatically registered to vote once the legal requirements are met. To this end, electoral registers are produced using integration and interoperability between the Civil Registry and Electoral Bodies Information Systems. There is no need to produce voter cards; citizens vote using their Identity Card (ID).

220

221 The table 1 above illustrates some ER models used in some countries. In this context,  
 222 the best practice that could be adapted to the Mozambican context is the Dutch model.  
 223 This practice is economically viable because it does not require investments in the  
 224 acquisition of computer equipment for ER, nor does it require the hiring of Electoral  
 225 Agents to operate the ER Brigades. Therefore, investments for this model are allocated  
 226 to the technological infrastructure of the Data Processing Centers (DPCs) and the hiring  
 227 of Electoral Agents to operate in the DPCs.

228 Nevertheless, implementing this model in Mozambique presents a significant challenge  
 229 for Electoral Offices, Civil Identification Agencies, and Internet Service Providers.  
 230 Furthermore, there is a need to make the Electoral Office Information Systems and Civil  
 231 Identification Information Systems more robust and resilient; in addition, Civil  
 232 Identification Information Systems and internet services must be robust, resilient, and  
 233 comprehensive, reaching all remote areas. On the other hand, there is a need to make the  
 234 national Cybersecurity system in Mozambique more robust and secure.

235 The series selected for the analysis of the ERIS model were: 2018, 2019, 2023 and  
 236 2024. According to international standards, the efficiency score should be restricted to  
 237 the range of 0 to 1, that is, between 0 and 100%.

238 Advances in electronics have led organizations to invest in Information and  
 239 Communication Technologies (ICTs), mainly with the objective of increasing efficiency  
 240 and productivity, and in the context of this scientific study, the domain of mitigating  
 241 greenhouse gases can also be included.

242 It should be noted that, in the series under analysis, many electoral materials were used  
243 on paper and other inputs, and there was also some contribution towards the increase in  
244 greenhouse gases.

245 The results of this research showed that eliminating the use of paper-based electoral  
246 materials in Mozambique, within the current ERIS model, and migrating to a fully  
247 digital model will positively influence the maximization of ERIS's efficiency and the  
248 mitigation of environmental impacts. Therefore, there is a need to completely eliminate  
249 the use of paper-based electoral materials and their associated inputs, especially in  
250 electoral processes, while maintaining all processes and documents in digital format.

251

### 252 **3.2. Analysis of Questionnaire Responses**

253 The questionnaires and interviews focused on the following actors: CNE members,  
254 DOOE heads, DOOE technicians, ER Brigade members, and citizen voters.

255 Analysis of all questionnaire and interview responses: the questionnaires focused on a  
256 sample composed of CNE members, DOOE heads with more than 15 years in this  
257 leadership position, DOOE technicians with more than 20 years of experience in the  
258 STAE, ER Brigade members who have participated in more than four ERs, and citizen  
259 voters who have registered more than four times. It should be noted that the frequency  
260 of use of RE ballots and other paper materials in this format, especially in the four series  
261 under study, was very high.

262

263 Analyzing all the responses received, it became clear that the use of a mixed model,  
264 digitized and combined with the simultaneous use of paper-based electoral materials  
265 and their respective inputs, creates scenarios of unnecessary redundancies in the  
266 electoral processes, makes the electoral system costly in Mozambique, and contributes  
267 to the proliferation of greenhouse gases.

268 It was also evident that what is driving this phenomenon is the resistance to change and  
269 the lack of sufficient confidence in a fully computerized ERIS-based model on the part  
270 of some stakeholders in the electoral processes, especially political parties with  
271 parliamentary seats, and the limitations of current electoral legislation. However,  
272 according to evidence from various scientific approaches found in the literature review,  
273 the redundancy in the use of paper-based electoral materials and their respective inputs  
274 in this model is not relevant; therefore, these materials make the model costly, slow

275 down the procedural speed, have negative environmental impacts, and are less secure  
276 with regard to the storage of electoral information.

277 However, models based on computerized ERIS (Electoral Registration and Information  
278 System) are, by themselves, sufficient, more efficient, secure, robust, easier to manage,  
279 and do not emit greenhouse gases. Through literature review, it was also proven that  
280 there is no need to print electoral materials on paper when registering voters in  
281 Mozambique. All processes related to the use of paper electoral materials should be  
282 discontinued, especially in the Mozambican electoral system model, and full confidence  
283 should be placed in fully digitized models.

284 From the perspective of the author of this scientific study, eliminating paper electoral  
285 materials and their respective inputs in the current model in Mozambique will increase  
286 the current efficiency score of the ERIS. The use of a fully digitized ERIS will  
287 significantly streamline the performance of tasks related to electoral registration and  
288 decision-making. It will reduce the financial burden on the Government of Mozambique  
289 and the emission of greenhouse gases. In fact, in this model, paper-based election  
290 materials increase the vulnerability of the system and election material warehouses with  
291 regard to fire risks.

292

### 293 **3.3. Analysis of Questionnaires Using the Likert Scale**

294 In this scientific research, the reliability of the questionnaire responses was evaluated  
295 using SPSS software based on the 5-point Likert scale. Measurement is one of the  
296 means by which data are accessed and described to understand facts and phenomena of  
297 interest. In this context, the handling of data from this scientific research generated  
298 information and knowledge that can be directed towards both academic and professional  
299 objectives and for the benefit of society.

300 Therefore, the Likert scale is the most widely used model among researchers. The  
301 Likert verification scale consists of taking a construct and developing a set of statements  
302 related to its definition, to which respondents will express their degree of agreement,  
303 perception, or satisfaction. This allows for the collection of opinions, impressions, and  
304 approaches in a clear and objective way. Table 2 shows an example of the 5-point Likert  
305 scale for measuring satisfaction with a service.

306 **Table 2: Example of a Likert scale (Likert 1932).**

I totally disagree	Discordo parcialmente	I neither agree nor disagree	I partially agree	I totally agree
1	2	3	4	5

307

308 According to Costa (2011), on this scale, respondents position themselves according to  
 309 a measure of agreement assigned to the item, and, according to this statement, the  
 310 constructor's measure is inferred.

311

312 **3.4. Analysis of the Cronbach's Alpha Reliability Coefficient of the Questionnaires**  
 313 **Using SPSS**

314 SPSS is a statistical package with different modules, developed by International  
 315 Business Machines (IBM) for use by professionals in the humanities and exact sciences.  
 316 It is an easy-to-use and very comprehensive tool, therefore, it allows for statistical and  
 317 graphical analyses with a wide range of data.

318 The analysis of the data collected through the questionnaires and the reliability of  
 319 Cronbach's Alpha were performed using SPSS software. Reliability analysis is a  
 320 measure that aims to define the degree to which measurements are free from errors and,  
 321 therefore, produce consistent results and measure the reliability of instruments and  
 322 constructions.

323 According to Campoy (2016), from 0 to 0.4 - is considered very low reliability, from  
 324 0.4 to 0.65 - is considered low reliability, from 0.65 to 0.75 - is considered acceptable  
 325 reliability, from 0.75 to 0.85, is considered high reliability, and from 0.85 to 1, is  
 326 considered very high reliability.

327

328 **3.5. Cronbach's Alpha**

329 Cronbach's alpha measures the correlation between responses in a questionnaire by  
 330 analyzing the profile of the answers given by respondents. It is an average correlation  
 331 between questions. Given that all items in a questionnaire use the same measurement  
 332 scale, the alpha coefficient is calculated from the variance of the individual items and  
 333 the variance of the sum of the items for each evaluator using the following equation:

$$\alpha = \left( \frac{k}{k-1} \right) \times \left( 1 - \frac{\sum_{i=1}^k S_i^2}{S_t^2} \right)$$

334

335 Where:

336 k - corresponds to the number of items in the questionnaire;

337  $s^2_i$  -corresponds to the variance of each item;

338  $s^2_t$  corresponds to the total variance of the questionnaire, determined as the sum of all  
 339 variances.

340 Cronbach's Alpha values range from 0 to 1; the closer to 1, the greater the reliability  
 341 between the indicators. However, to calculate Cronbach's alpha coefficient, all  
 342 responses must be transformed into scores.

343

344 **Table 3: Validation of questionnaire items for CNE Vowels.**

		N	%
<i>Cases</i>	<i>Valid</i>	16	100.0
	<i>Excluded</i>	0	.0
	<i>Total</i>	16	100.0

345

346 N - represents the number of questions for the questionnaire intended for CNE  
 347 members; in this context, there were 16 questions.

348

349 **Table 4: Cronbach's Alpha for CNE Members.**

<i>Cronbach's Alpha</i>	<i>N of Items</i>
.988	10

350

351 In total, questionnaires were sent to 10 CNE members; therefore, for the reliability of  
 352 the questionnaires sent to the CNE members, Cronbach's alpha is 0.99, which is  
 353 considered very high reliability.

354

355 **Table 5: Validation of questionnaire items for heads of DOOEs.**

		N	%
<i>Cases</i>	<i>Valid</i>	7	100.0
	<i>Excluded</i>	0	.0
	<b>Total</b>	<b>7</b>	<b>100.0</b>

356 **Table 6: Cronbach's alpha for heads of DOOEs.**

<i>Cronbach'sAlpha</i>	<i>N ofItems</i>
.877	13

357

358 The Cronbach's alpha of the questionnaires sent to the 7 heads of the DOOE is 0.88,  
 359 which is considered very high reliability. Therefore, for these, the questionnaires had 13  
 360 questions each.

361

362 **Table 7: Validation of questionnaire items for DOOE technicians.**

		N	%
<i>Cases</i>	<i>Valid</i>	15	100.0
	<i>Excluded</i>	0	.0
	<b>Total</b>	<b>15</b>	<b>100.0</b>

363

364 **Table 8: Cronbach's alpha for DOOE technicians.**

<i>Cronbach'sAlpha</i>	<i>N ofItems</i>
.927	7

365 While the Cronbach's alpha of the questionnaire for the 15 DOOE technicians is 0.93, it  
 366 is considered very high reliability. Therefore, the questionnaire consisted of a total of 7  
 367 questions.

368

369 **Table 9: Validation of questionnaire items for ER Brigades.**

		N	%
<i>Cases</i>	<i>Valid</i>	10	100.0
	<i>Excluded</i>	0	.0
	<b>Total</b>	<b>10</b>	<b>100.0</b>

370

371 **Table 10: Cronbach's Alpha for ER Brigade.**

<i>Cronbach'sAlpha<sup>a</sup></i>	<i>N ofItems</i>
.817	5

372

373 The questionnaire sent to the 10 ER Brigade members consisted of 5 questions;  
374 therefore, the Cronbach's alpha obtained is 0.82, which is considered high reliability.

375

376 **Table 11: Validation of questionnaire items for citizen voters.**

		N	%
<i>Cases</i>	<i>Valid</i>	20	100.0
	<i>Excluded</i>	0	.0
	<i>Total</i>	20	100.0

**Table 12: Cronbach's Alpha for Voting Citizens.**

<i>Cronbach'sAlpha<sup>a</sup></i>	<i>N ofItems</i>
.995	2

377

378 For voting citizens, 20 questionnaires consisting of two questions were sent; however,  
379 the Cronbach's alpha obtained is 0.99, which is considered very high reliability.

380

381 For CNE members, DOOE heads, DOOE technicians, and voting citizens, the  
382 Cronbach's alpha reliability obtained was very high, while for ER Brigade members, the  
383 Cronbach's alpha reliability obtained was also high. The five questionnaires used for  
384 data collection also demonstrated a good correlation between the items. Therefore, the  
385 validity of internal consistency through Cronbach's alpha demonstrated that the  
386 application of such a coefficient allows us to assess the consistency between the items,  
387 as well as their responses, providing an estimate of the true reliability of an instrument  
388 for the given measurements.

389 The Cronbach's alpha values obtained are: for the CNE members, the Cronbach's alpha  
390 was 0.99 - very high reliability; for the DOOE chiefs, the Cronbach's alpha was 0.88 -  
391 very high reliability; for the DOOE technicians, the Cronbach's alpha was 0.93 - very  
392 high reliability; for the RE Brigade members, the Cronbach's alpha was 0.82 - high  
393 reliability; and for the voting citizens, the Cronbach's alpha was 0.99 - very high  
394 reliability. Note that among the Cronbach's alpha values obtained, the minimum was  
395 0.82 and the maximum was 0.99. The average reliability of the five questionnaires was  
396 0.92 - very high reliability. However, the values obtained through Cronbach's alpha  
397 coefficient in this scientific study demonstrate the existence of excellent reliability  
398 between questions and their answers in the 5-point Likert scale format; there is a  
399 positive association between the items and their respective answers.

400 According to the evidence found in the questionnaires, in order to improve the  
401 efficiency of the ERIS model used by STAE in Mozambique, it is recommended to fully  
402 digitize and eliminate the use of all paper-based RE materials and their respective inputs  
403 at all stages of the ER process. In this scientific research, analyses of the ERs carried out  
404 in the years 2018, 2019, 2023 and 2024 were performed, and in the context of data  
405 collection and analysis, studies that used a mixed-methods approach were sought.

406

#### 407 **4. Conclusions**

408 This work sought to contribute to scientific studies for the analysis of the efficiency of  
409 the ERIS model in use in Mozambique, mainly with regard to the use of paper-based  
410 RE materials and their respective inputs. Considering that the general objective of this  
411 scientific article was to "Propose an efficient ERIS model in Mozambique, which  
412 integrates modern technologies to optimize the census process, improve data accuracy  
413 and increase citizen participation", the results indicate that the excessive use of  
414 redundant paper materials in the years 2018, 2019, 2023 and 2024 negatively impacted  
415 both the efficiency of the system and its environmental impacts.

416 The research revealed that the elimination of these redundant materials could  
417 significantly improve the effectiveness of ERIS. The proposed model for ERIS proves  
418 to be effective in mitigating the problems identified during the implementation of ER.

419

#### 420 **5. Recommendations**

421 It is recommended to promote the use of fully digitized Information System models,  
422 without redundant paper materials, especially in the ER and voting processes.

423 Regarding the technological offering for the full digitization of the ERIS model  
424 proposed in this research, although proprietary solutions are the most complete, the  
425 implementation of open-source technologies is recommended.

426 The implementation of the integration and interoperability of the Mobile IDs of the ER  
427 Stations to the DPCs is recommended. The implementation of redundant, robust, and  
428 resilient electoral DPCs infrastructures at the Central STAE, Provincial STAEs, and  
429 District STAEs levels is also recommended.

430
