### *Detailed Reviewer's Report*

This case report describes a 49-year-old female who developed nausea, vomiting, abdominal distension, and mild LFT derangement after starting rosuvastatin/fenofibrate combination, with resolution after drug discontinuation. The topic is clinically relevant, but the manuscript has several shortcomings.

#### Major Comments

1. **Timeline imprecise** – "within a week's time" vs. "after three to five days" vs. "few days" – inconsistent and vague.
2. **Incomplete investigation data** – No actual lab values (LFTs, lipase/amylase to rule out pancreatitis). Mentioned "mildly deranged" without numbers.
3. **Missing Naranjo scale or causality assessment** – Standard for case reports on ADRs.
4. **Discussion too speculative** – Overly long recommendations section (dosing, monitoring) that reads like a guideline, not a case discussion.
5. **Reference formatting errors** – References 2, 3, 4 are incomplete (missing authors, titles, or journal names).

## REVIEWER'S REPORT

### Minor Comments

- Abstract mentions "promptly within 3-7 days" – be consistent.
- Patient is a doctor by profession – this is noteworthy but not explored.
- Vitamin D 60k weekly mentioned but irrelevant; consider removal.
- No statement on whether other medications were ruled out as cause.
