Reviewer's Comment for Publication.

This study assessed the knowledge of 30 staff nurses regarding stem cell therapy using a structured questionnaire. The results showed that most nurses (73.3%) had moderately adequate knowledge, while 16.7% had adequate knowledge and 10% had inadequate knowledge. No significant association was found between knowledge level and demographic variables.

Strength:

1. Relevant topic in modern healthcare and regenerative medicine.
2. Clear objectives and research methodology.
3. Simple and easy-to-understand data presentation.
4. Useful findings for planning educational programs for nurses.

Weakness:

1. Small sample size (30 nurses), limiting generalization of results.
2. Convenience sampling may introduce bias.
3. Numerous grammatical, spelling, and formatting errors throughout the manuscript.
4. Discussion section is brief and lacks critical analysis.
5. References and literature review need updating with more recent studies.

Overall assessment:

The study addresses an important nursing education topic and provides useful preliminary data. However, substantial improvement in language, formatting, and discussion is required before publication.

Recommendation: Manuscript accepted for publication.
