### *Detailed Reviewer's Report*

- Ogilvie syndrome, also known as acute colonic pseudo-obstruction, is a sudden, severe paralysis of the colon. It acts exactly like a physical bowel blockage, causing massive distention, but imaging reveals no structural obstruction. It is a medical emergency that can lead to bowel perforation and sepsis.**
- Ogilvie syndrome, also known as acute colonic pseudo-obstruction (ACPO), is a sudden and temporary paralysis of the large intestine. It mimics the symptoms of a physical bowel obstruction—causing severe abdominal swelling, nausea, vomiting, and constipation—even though no physical blockage exists.**
- Acute Colonic Pseudo-Obstruction (ACPO), also known as Ogilvie syndrome, is a sudden, functional paralysis of the colon. It mimics a mechanical blockage but is driven by a nervous system imbalance. The colon becomes massively distended; if unmanaged, it risks bowel ischemia and perforation.**
- Acute Colonic Pseudo-Obstruction (ACPO), also known as Ogilvie syndrome, is a sudden, functional paralysis of the colon. It mimics a mechanical blockage but is driven by a nervous system imbalance.**

**REVIEWER'S REPORT**

The colon becomes massively distended; if unmanaged, it risks bowel ischemia and perforation.

5. Total hip arthroplasty (THA), or total hip replacement, is a highly successful surgery where a damaged, arthritic, or fractured hip joint is surgically removed and replaced with artificial prosthetic components. The procedure relieves pain, restores mobility, and dramatically improves the patient's quality of life.
6. Post-operative complications are adverse events occurring after surgery. They range from minor side effects (like post-operative nausea) to severe, life-threatening issues (like pulmonary embolism). The most common complications can be broken down into systemic and surgical categories.
7. A cecostomy is a procedure that creates a small opening into the cecum (the first part of the large intestine) through the abdomen. It is primarily used to help manage severe chronic constipation and fecal incontinence by allowing patients to administer daily "antegrade enemas" (flushing the bowel from the top down).
8. Key words are good
9. Result part can be made tables with graphs.
10. Pictures are good.
11. Significant points are given awesome .
12. Summary points can be included.
13. References should be with alphabetical order.
14. After those changes can be published in your journal.
