Detailed Reviewer's Report

Strength of the study:

- The case addresses an uncommon and clinically relevant male sexual dysfunction that is not frequently reported in literature
- The manuscript presents a detailed patient history, clinical findings, treatment plan, and follow-up outcome in a clear sequence
- The improvement in intravaginal ejaculation followed by natural conception adds practical clinical value to the report
- Integration of Ayurvedic concepts with modern clinical understanding makes the case interesting and informative
- Patient consent has been clearly mentioned, supporting ethical reporting of the case

Weakness of the study:

- This is a single case report, so findings cannot be generalized to a larger population
- Objective outcome measures after treatment are limited and more follow-up laboratory comparisons would strengthen the report
- The manuscript contains several grammatical errors, spacing issues, and repeated words in some sections
- The discussion could include stronger comparison with previous case reports or related studies
- Some treatment details need clearer scientific explanation for wider clinical interpretation

Reviewers Comments:

This manuscript presents an interesting case report on the Ayurvedic management of situational anejaculation with delayed ejaculation in an obese hypertensive male. The topic is clinically relevant because such conditions are uncommon and can significantly affect fertility, mental well-being, and marital life. The case history is described in detail, and the treatment timeline is easy to follow. The reported clinical outcome, including restoration of intravaginal ejaculation and subsequent natural conception, adds value to the report. Patient consent has been mentioned clearly, which supports the ethical aspect of publication. The manuscript is generally well organized and readable. However, the language requires careful proofreading, as there are grammatical errors, repeated headings, spacing inconsistencies, and a few awkward sentence constructions throughout the text. Being a single case report, the major limitation is lack of broader applicability and limited objective post-treatment assessment. Still, the work is meaningful and contributes useful clinical observation. Overall, the manuscript is suitable for publication after minor revision and language editing.

REVIEWER'S REPORT

Previously Published anywhere/Plagiarism check:

There is no clear indication that this manuscript has been published previously. The case appears original and based on direct clinical observation with documented follow-up. The content seems independently prepared with appropriate references. A routine plagiarism screening before publication is recommended to confirm originality and identify any minor textual overlap with previously published literature.
