### *Detailed Reviewer's Report*

#### Strength of the study:

- The study addresses a common and clinically relevant ophthalmic condition
- Prospective observational design allows systematic collection of patient data
- Adequate sample size of 100 patients strengthens the observations
- Clinical features and treatment outcomes are clearly presented
- Inclusion and exclusion criteria are well defined
- Follow up outcomes are documented systematically
- Findings have practical value for routine ophthalmic practice and patient education

#### Weakness of the study:

- Diagnosis was based solely on clinical findings without laboratory confirmation
- Study duration was relatively short
- Single centre design limits generalizability of results
- Detailed statistical analysis is lacking
- Ethical clearance and informed consent statements are not mentioned
- Potential seasonal variation was not explored
- Minor grammatical and formatting inconsistencies are present throughout the manuscript

#### Reviewers Comments:

This manuscript presents a prospective observational study evaluating the clinical characteristics and treatment outcomes of viral conjunctivitis. The topic is important because viral conjunctivitis remains one of the most common causes of ocular morbidity and outpatient ophthalmology visits. The study includes a reasonable sample size and provides useful information regarding demographic distribution, clinical manifestations, ocular findings, and recovery patterns. The results are clearly presented and support the conclusion that viral conjunctivitis is generally a self limiting condition with favorable outcomes following supportive treatment. The manuscript is organized in a logical manner and is easy to follow. However, ethical clearance and informed consent procedures should be clearly mentioned to ensure compliance with research ethics requirements. The study is limited by its single centre design, short duration, and lack of laboratory confirmation of viral etiology. Statistical analysis could also be strengthened to improve scientific rigor. Minor grammatical, formatting, and language corrections are recommended. Overall, the manuscript contributes useful clinical information and is suitable for publication after minor revision.

## REVIEWER'S REPORT

### **Previously Published anywhere/Plagiarism check:**

There is no indication within the manuscript that this study has been published previously. The work appears to be an original observational study based on prospectively collected clinical data. No obvious evidence of plagiarism was identified during review. However, a formal plagiarism and similarity assessment should be conducted before publication to verify originality and ensure compliance with standard publication ethics and journal policies.
