Clarity	Excellent			
Significance	Excellent			

Reviewer's ID: Dr. Sumathi

Detailed Reviewer's Report

- 1. Pregnancy (also known as gestation) is the period in which one or more offspring develops inside a woman's uterus. Lasting approximately 40 weeks from the first day of the last menstrual period, it is divided into three distinct trimesters, each bringing specific physical and emotional changes.**
- 2. Pancreatitis is the inflammation of the pancreas, often occurring when digestive enzymes prematurely activate and attack the gland itself. It has two main forms: acute (sudden onset) and chronic (long-term, progressive inflammation). The most common causes are gallstones and heavy alcohol use.**
- 3. Diagnostic refers to the process or tools used to identify the nature, cause, or characteristics of a problem, illness, or system failure. It is most commonly associated with medical testing, mechanical troubleshooting, and software analysis.**
- 4. A complication is a secondary condition, unexpected difficulty, or complex feature that makes a primary situation harder to manage. The term originates from the Latin *complicare*, meaning "to fold together". Its application spans several distinct fields.**

REVIEWER'S REPORT

- 5. Acute pancreatitis during pregnancy is a rare but life-threatening emergency, primarily caused by gallstones or hypertriglyceridemia. It typically strikes in the third trimester or postpartum. Management requires a multidisciplinary approach focusing on conservative, supportive care, with timely delivery and targeted surgical interventions only when necessary.**
- 6. In healthcare, a complication is a new, secondary medical issue that arises during the course of a primary disease or following a treatment. For example, a patient recovering from surgery might develop an infection or blood clot as a complication. Disease-specific complications, such as kidney failure resulting from diabetes, can severely impact recovery and care options.**
- 7. Acute pancreatitis in pregnancy is a rare but serious condition that requires immediate multidisciplinary care. Typically presenting in the third trimester as severe upper abdominal pain and vomiting, it is most commonly triggered by gallstones or high triglycerides. Management focuses on aggressive fluid resuscitation, pain control, and fetal monitoring.**
- 8. Key words are good. But can be added more words.**
- 9. Significant points are good.**
- 10. Result part is awesome with graphs.**
- 11. Summary points only can be added.**
- 12. References are sufficient. But can be altered in alphabetical order.**
- 13. After a small changes can be published in your journal.**
