Detailed Reviewer's Report

This manuscript provides a useful overview of agricultural storage systems, but significant issues require major revision. The methodology is described merely as a "systematic literature review" without detailing the search strategy, inclusion/exclusion criteria, or analytical framework undermining reproducibility. The results section reads as a descriptive catalogue of storage methods rather than a critical synthesis with comparative evaluation. The temperature range for refrigeration storage is incorrectly stated as 50–200°C, which is clearly erroneous. The discussion lacks engagement with the literature cited in the introduction, and the conclusion offers generic recommendations without actionable insights. References are insufficient (only four) and include informal sources, while the final paragraph repeats content from earlier sections. The authors must clarify their methodological protocol, correct factual errors, strengthen the critical synthesis, and expand the reference base to support their claims. With substantial revision, the paper could offer value to those seeking an accessible introduction to storage systems in developing regions.
