Detailed Reviewer's Report

1. A psychological phenomenon is an observable, recurrent fact or event involving human thought, emotion, or behavior. It describes how the mind works in a specific situation. Researchers spot these patterns through repeated study. They differ from theories, which try to explain *why* the events happen.
2. Time perception, or chronoception, is the subjective and malleable experience of how the human mind measures the passage of time and the duration of events. Unlike physical time measured by clocks, our internal sense of time changes based on attention, emotion, memory formation, and biological rhythms.
3. Time perception, also known as chronoception, is the subjective experience of the passage and duration of time. While physical time ticks forward at a constant, linear rate, the human brain constructs an internal sense of time that is incredibly fluid and easily distorted. It is shaped by a complex interplay of attention, memory, age, and emotion.
4. This research topic is given very simply with out clear information.

REVIEWER'S REPORT

- 5. Must be rewrite the research topic with Abstract, key words, introduction, review of literature, result with tables and graphs, discussion with more references, summary, conclusion and references with alphabetical order. Should be included some pictures.**
- 6. After those changes only can be published.**
- 7. With out any information not possible to publish in your journal.**
