Detailed Reviewer's Report

Major Comments

1. The proposed mechanism (phrenic nerve referral) is speculative and based on indirect evidence. The authors acknowledge this limitation, but the Discussion could better distinguish hypothesis from established fact.
2. The absence of quantitative CMR mapping parameters (T1/T2 values) weakens diagnostic certainty. If available, these should be included; if not, this limitation should be more prominently stated.
3. The claim of no prior similar cases is based on a "non-exhaustive search." This should be softened or a more systematic search strategy described.
