Reviewer's Comment for Publication.

The manuscript presents a relevant and well-structured review of cyber resilience for distributed giga-project IT infrastructure in Saudi Arabia. It effectively integrates ISO 27001, ISO 22301, hybrid-cloud security, business continuity, incident response, recovery engineering, and Saudi cybersecurity requirements. The proposed resilience architecture, assurance loop, control-to-evidence matrix, and resilience metrics provide useful practical value. Minor revisions are recommended to further improve the manuscript. The review methodology should provide clearer details regarding the search and selection process and the basis for the stated 30-source evidence base. Figures 1 and 2 and Tables 1 and 2 should be checked for clarity, formatting, and consistency. Saudi-specific regulatory requirements and standards should be carefully cross-checked with the cited references. The manuscript should also be proofread for grammar, terminology, and formatting consistency. With these minor improvements, the manuscript can be considered suitable for publication.
