Detailed Reviewer's Report

The manuscript addresses an important topic concerning antenatal care, nutritional practices, lifestyle behaviors, and psychological well-being among pregnant women in Udaipur, Rajasthan. The study covers relevant maternal health indicators and highlights important gaps in preconception care, dietary diversity, and supplement adherence. However, minor revisions are required to improve methodological transparency and reporting consistency. The authors should clarify the sampling technique, study period, recruitment setting, questionnaire development and validation, and the criteria used to define adequate antenatal contacts, dietary diversity, and supplement adherence. The statistical analysis should be reported more clearly, including the tests used for the associations and the exact p-values where appropriate. The authors should also reconcile inconsistencies between the abstract, tables, and results, particularly regarding the presentation of demographic data and lifestyle practices. Ethical approval details should be provided, and the references should be checked for completeness, accuracy, and duplication. With these clarifications and corrections, the manuscript may be considered for publication.
