Detailed Reviewer's Report

1. **A thyroglossal duct cyst (TDC) is a fluid-filled pocket or lump in the middle of the front of the neck. It is the most common congenital (present from birth) neck mass, usually found in children under age 10.**
2. **A thyroglossal duct cyst (TDC)—also called a thyroglossal tract cyst—is a congenital, fluid-filled lump that develops in the front midline of the neck. It is the most common congenital neck anomaly, affecting roughly 7% of the population. While individuals are born with this cyst, it is frequently discovered in young children under the age of 10 or during adolescence when it swells, often following an upper respiratory infection.**
3. **A thyroglossal duct cyst (TGDC) is a fluid-filled, congenital neck mass that can occasionally present in adults like a 47-year-old, though it most commonly appears in childhood.**
4. **A thyroglossal duct cyst (TGDC) is a congenital anomaly that occurs due to a persistent remnant of the thyroglossal tract as the thyroid gland migrates from the base of the tongue during embryonic development. While roughly 70% of these midline masses are**

REVIEWER'S REPORT

discovered in early childhood, about 7% of cases remain completely asymptomatic or unnoticed until adulthood, occasionally presenting in patients in their 40s or older.

5. **All information are given very simply.**
6. **Abstract with key words must be given.**
7. **Result part tables with graphs can be made.**
8. **Summary points also be added.**
9. **References not given totally. Without references how possible to publish paper.**
10. **After those changes without fail and eligible to publish in your journal.**
