Reviewer's Comment for Publication.

The manuscript addresses a relevant and significant topic concerning secure cloud platform governance, with particular emphasis on SAP Business Technology Platform, identity management, access control, and cybersecurity compliance in the context of Saudi Vision 2030. The paper is well organized and presents a coherent integrative framework connecting administrative responsibilities, identity governance, technical enforcement, and regulatory assurance. The discussion of shared responsibility, privileged access, service identities, data protection, and continuous monitoring is informative and demonstrates a good understanding of the subject. The proposed tables and conceptual framework strengthen the practical relevance of the study. However, minor revisions are recommended to improve the consistency and precision of certain technical and regulatory explanations, clarify the source-selection process, and ensure that the proposed governance indicators and framework are clearly distinguished from empirically validated outcomes. Overall, the manuscript makes a useful conceptual contribution and is suitable for publication after minor revision.
